

Coalesce

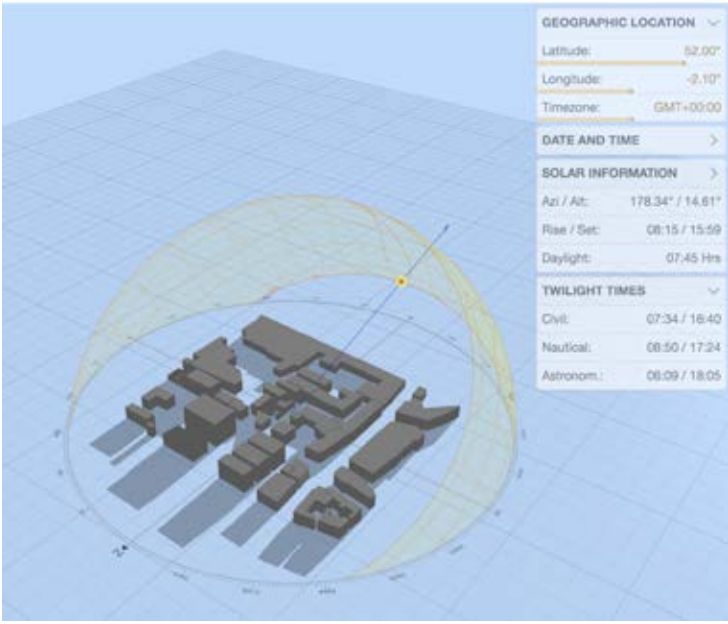

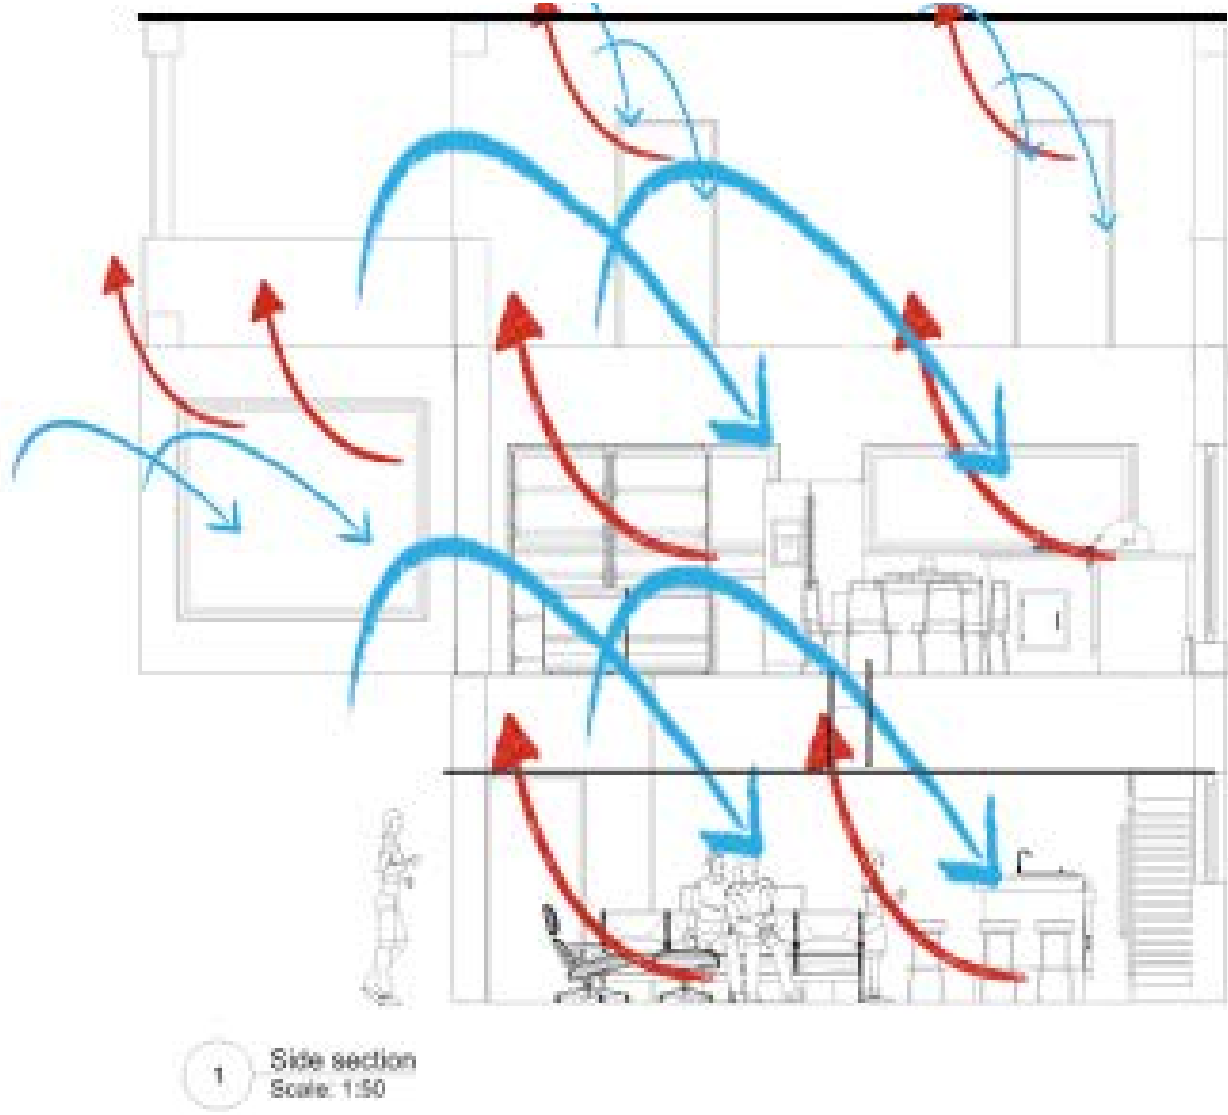

The aim of this design is to produce a space that is easy to navigate through, whilst still giving space to a number of elements. Combining materials that are opposite in nature, into one space to show the unification of the two materials and how they can coexist. Allowing the different materials to show two different spaces. This allows the living space to feel: relaxed, comfortable and natural, and the working space to feel : clean, precise and harsh.

Ashwin street in Dalston allowed me to create a private space that could contain a public space within it. The area is busy at times and has access to a foot traffic, while still offering privacy and reduced noise levels. This was useful as I was able to include a gallery for public use offering my artist the choice to interact with possible clients within his own home. The site would be next to existing buildings which would block the sun paths, this effected my design so I had to use special design techniques to ensure the maximum amount of natural lighting reaches the entire space.

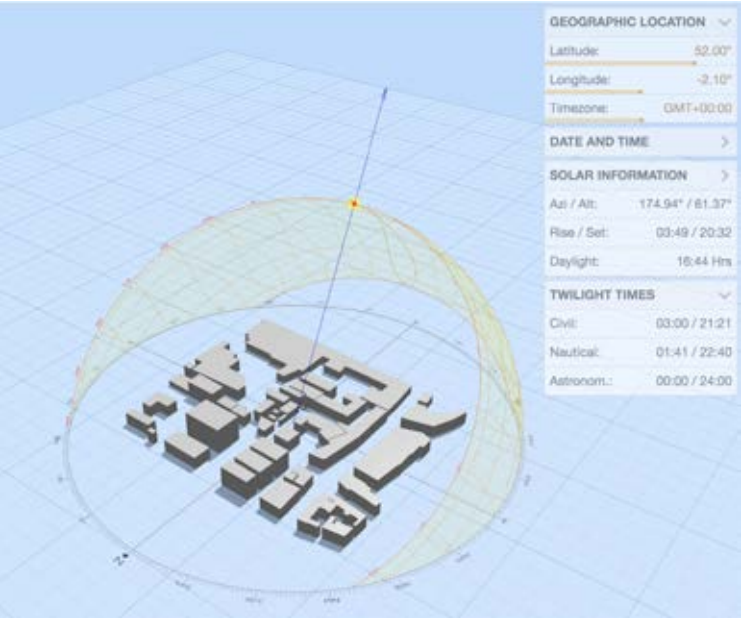

My artist, Lebo Tladi, specialises in drawing, graphic design and he is starting to produce paintings and sculptures. His work varies and most of it follows an abstract theme, with a number of them containing liner and geometric forms. He uses nature for his inspiration, and he is fond of anything that surrounds nature. This left me to design several green spaces that would make him feel comfortable. The main garden divides the two entrances giving life to different trees and shrubs, with added space to grow a garden on the third floor where his bedroom is located. The idea of using natural lighting was crucial as he prefers to work with day light when drawing and with artificial lighting when he uses his computer, thus I added a translucent section to his studio so a part of it will use as much sunlight as possible.

Lighting became a crucial part in my design, as some parts don't receive the same light, I had to use various windows to find the best one that will bring in sufficient natural lighting. I used techniques such as top window lighting and placing the windows in the best location.

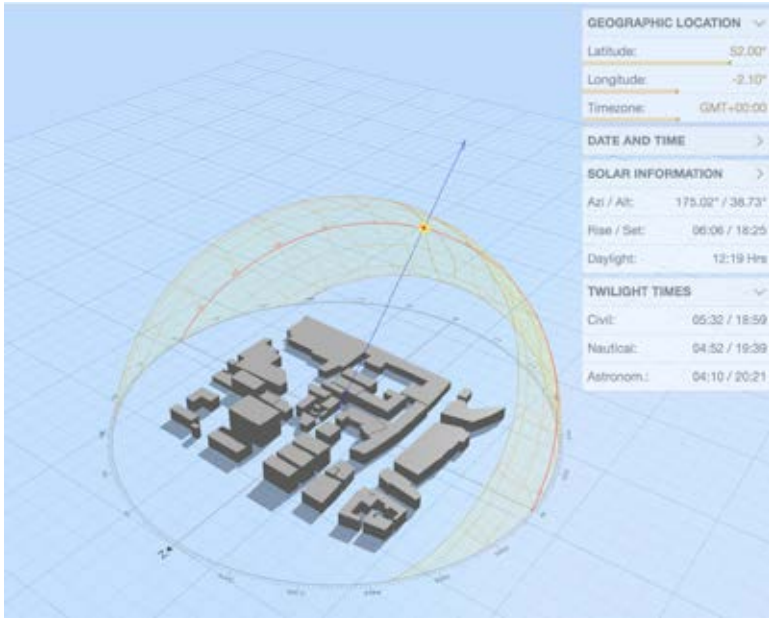

My idea evolved from several plaster moulds that I created based on designs I had. Each time I learnt new things and eventually I started using the plaster to my advantage to create thicker sides, longer walls and different shapes. After creating the moulds, I gathered them together to end with my final design, I did this by choosing the best moulds that would offer a unique space. Ending with two parts, one private and one public, as well as having an entrance in the front. I included the entrance to show different the different spaces. The private space which is more closed with a smaller entrance and the public space which is more open with places for people to sit.
