

Frei Otto

Frei Otto's umbrella pavilion was used to create shade and collect water, a kinetic system that opens according to user preference. It gave me inspiration to develop a system that can be used to collect both sun and water using a vertical pulley to open and close the system.

Doan Thanh Ha & Tran Ngoc Phuong- Rice paddy field

The rice paddy field by HP interested me due to its concept of connecting settlement and settled agriculture. Creating a growing system within and around a building. Merging into an architectural system that can grow food while allowing people to use the surrounding spaces. Using gravity, a hydroponic soilless system water is sent down using gravity reducing electricity costs and enhancing its performance.
