

This design allowed for sufficient space within each area. Starting with a walkway that allows you to see through the space then entering the wet area, moving towards the wet outdoor area which gives access to the outside garden where the jungle gym is located, the next area is the dry outdoor area which leads into the dry area, and finally the last two rooms are the quiet area and quiet room (one is bigger and the other is smaller.)The idea is to create a maze with the pillars and only people who know the site will be able to navigate through it with ease while allowing children to travel through the space without an confusion or feeling of being lost. Light tunnels and sliding doors will be added along with the pillars to combat the changing seasons and how they affect the space differently depending on the season so the space is adaptable to each season.

The Design

A temporary space that is easy to assemble, using a grid system the temporary space can be put up with ease. Large in size but broken down into sections to make the assembly easier. The feeling inside is similar to a maze and navigation gets easier with time spent in the space. Sliding doors separate the space and divide the rooms depending on which area is being used, offering different spaces that can be used through the day
